

# Clipping Line

## Experiment procedure documentation

---

### Introduction :

This document contains the stepwise instructions and supporting images to run this experiment and understand the working of the Cohen Sutherland algorithm through it.

### Instructions:

1. To open the webpage , run LineClippingng.html on your preferred browser.

[For a multiple line clipping demo](#)

[CLICK HERE!](#)

### Clipping Line-Cohen SutherLand Algorithm

Enter The Dimensions of Rectangle  
(The coordinates should be diagonal endpoints)

Maximum permissible value is (500,500)

Default values to run the experiment have been assigned

100	<input type="text"/>	x1	100	<input type="text"/>	y1
400	<input type="text"/>	x2	250	<input type="text"/>	y2

10	<input type="text"/>	x1	50	<input type="text"/>	y1
500	<input type="text"/>	x2	450	<input type="text"/>	y2

To begin the experiment click on

For an iterative clipping process, click on

To go back to the previous state of the algorithm , click on

[LINK TO USER GUIDE](#)

The user can run the experiment with the default values, or enter their own set of coordinates , for the bounding rectangle( our viewport) and for the line to be clipped.

Maximum Permissible value for each is 600 . If the user tries to enter a value greater than 600 , the values will be set to 600.

2. To start the experiment, click on the “**START**” button.

This will first generate an alert

### Clipping Line-Cohen SutherLand Algorithm

Enter The Dimensions of Rectangle  
(The coordinates should be diagonal endpoints)  
Maximum permissible value is (500,500)

Default values to run the experiment have been assigned

100	:	x1	100	:	xy1
400	:	x2	250	:	xy2

10	:	x1	50	:	y1
500	:	x2	450	:	y2

Demonstration of the cohen sutherland algorithm

Let us begin

OK

To begin the experiment click on

START

For an iterative clipping process, click on

NEXT STEP

To go back to the previous state of the algorithm , click on

PREV STEP

[LINK TO USER GUIDE](#)

### 3. Click on “OK”

This will now draw the bounding rectangle and the Line to be clipped .

A Grid will also be generated which denotes the 9 regions the canvas is divided into , which correspondingly have their own out-codes.

### Clipping Line-Cohen SutherLand Experiment

4. Click on “NEXT STEP” for the algorithm to proceed and iteratively clip the line w.r.t each edge of the bounding rectangle starting from the left and moving clockwise.

### Clipping Line-Cohen Sutherland Algorithm

Enter The Dimensions of Rectangle  
(The coordinates should be diagonal endpoints)

Maximum permissible value is (500,500)

Default values to run the experiment have been assigned

100	↕	rx1	100	↕	ry1
400	↕	rx2	250	↕	ry2

10	↕	x1	50	↕	y1
500	↕	x2	450	↕	y2

Final coordinates of the clipped line are  
(256, 250) & (100,123)

You can now enter new values!

To begin the experiment click on

[START](#)

For an iterative clipping process, click on

[NEXT STEP](#)

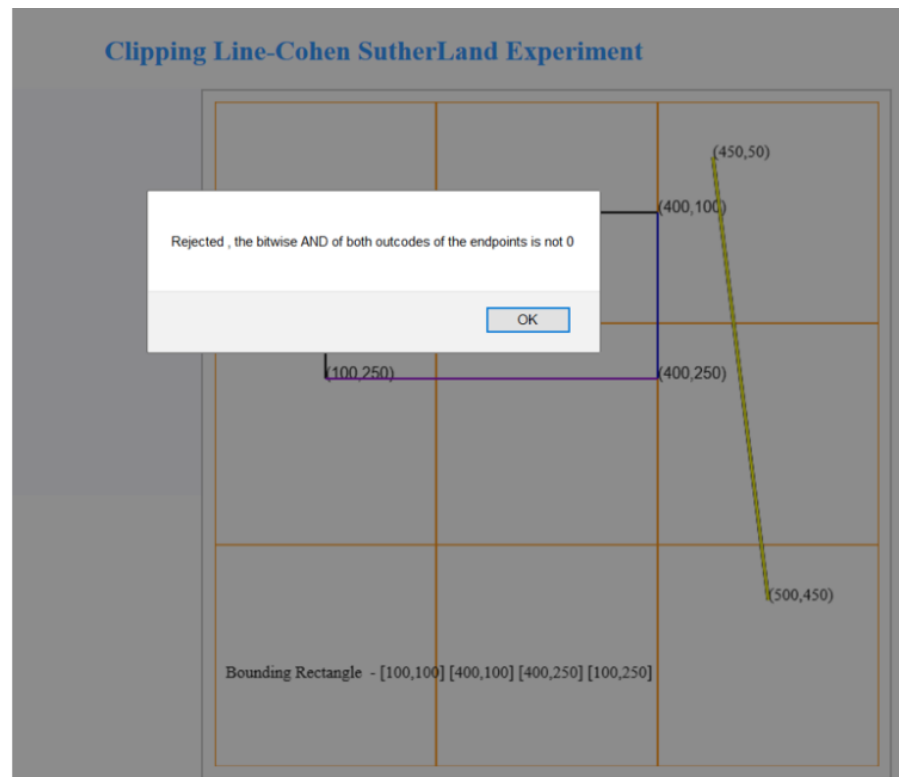

To go back to the previous state of the algorithm, click on

[PREV STEP](#)

The above image is the result of the iterations shown in point no.4

The Line has been clipped and the new coordinates have been filled on the canvas along with their display on the left side of the webpage.

7.If the line is not accepted , there will be an alert generated along with a message on the left.

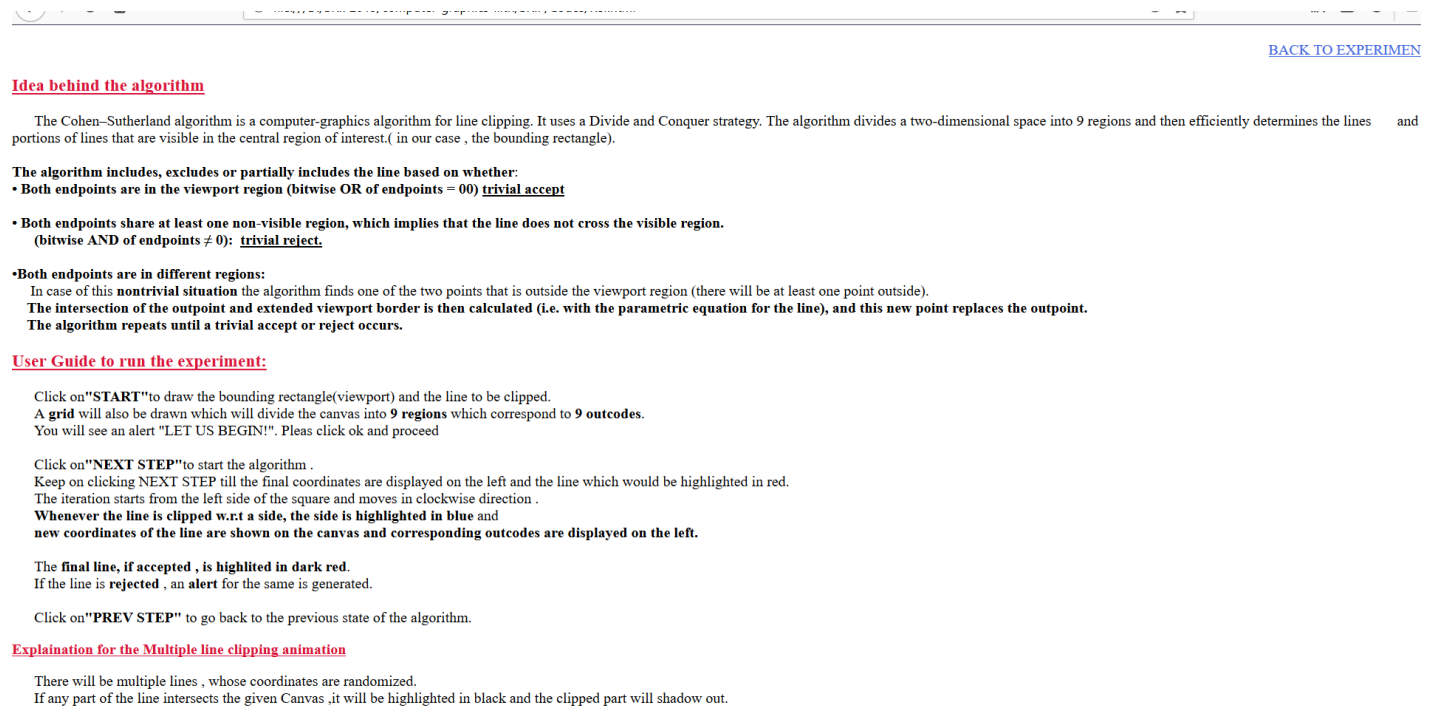

Line is rejected, No part is inside the Bounding rectangle

Experiment Ends Here

**8.** There is also an added functionality for viewing a multiple line clipping animation which generated random lines ,shadows out the clipped part and highlights the accepted part of the line by the bounding rectangle , in black.

This is how the user guide looks.

Please press “START” to begin the experiment .

You can enter your own values and run the experiment.

The user guide has all the steps and explanation of the algorithm and how it has been implemented in Javascript in an iterative fashion.
